

01 Project Initialization

first try the chat :

the inline ghost-text suggestions appear !

02 Try Inline Completion

tried to write an comment and let cursor help me

can see that is worked!

```
const taskInput = document.getElementById("taskInput");
const addBtn = document.getElementById("addBtn");
const taskList = document.getElementById("taskList");
const taskCount = document.getElementById("taskCount");

let count = 0;

addBtn.addEventListener("click", function () {
  const task = taskInput.value.trim();

  if (task === "") {
    return;
  }

  const li = document.createElement("li");
  li.textContent = task;

  taskList.appendChild(li);

  count++;
  taskCount.textContent = count;

  // Clear the input after adding the task
  taskInput.value = "";
});
```

try to make it help me in a whole new function:

```
function resetTasks(){} function resetTasks(){
  taskList.innerHTML = "";
  count = 0;
  taskCount.textContent = count;
```

03 Scaffold a New File with Composer

the application design at first :

Task Counter

Add Task

Total Tasks: 0

after I prompted Cursor to “**make the CSS more user friendly**” it suggested several styling improvements. I reviewed and accepted the changes, and the application was updated to the following design :

Task Counter

Add Task

Clear Tasks

t1

2

3

3

333

Total Tasks: 5

nice!

add new feature

prompt :

Add a Delete button next to each task. When the user clicks Delete, remove that task and update the total task count. Keep the existing design simple and do not change anything else.

Task Counter

Add TaskClear Tasks

try feature

Delete

worked !!!

Delete

Total Tasks: 2

04 The AI Feature Sprint

prompt :

“Add a complete search feature to my existing Task Counter app. Requirements: - Add a search input above the task list. - The user should be able to type any text in the search box. - Filter the existing tasks in real time while the user is typing. - The search should be case-insensitive. - Do not delete or modify the original tasks; only hide the tasks that do not match the search. - If the search box is empty, show all tasks again. - Keep the existing Add Task, Delete Task, Reset Tasks, and task counter functionality working exactly as before. - Style the search input so it matches the current design. - Use only HTML, CSS, and vanilla JavaScript. - Do not add any external libraries. - Make only the changes necessary for this feature.”

A UI mockup for a 'Task Counter' application. It features a title 'Task Counter' at the top. Below the title is a text input field with the placeholder 'Enter a task'. Underneath the input field are two buttons: a blue 'Add Task' button and a light gray 'Clear Tasks' button. Below these buttons is a search input field with the placeholder 'Search tasks'. A large, empty rectangular box with a dashed border is positioned below the search field, intended for displaying task details. At the bottom right, there is a 'Total Tasks:' label followed by a blue circle containing the number '0'.

Task Counter

Add TaskClear Tasks

Total Tasks: 0

05 Review the AI's Code Like a Pull Request

If a teammate submitted this as a pull request, I would suggest moving the search logic into a separate function to make the code easier to maintain. I would also add a small message when no tasks match the search. Overall, the feature is simple, consistent with the rest of the project, and does not introduce any obvious security issues.

Task 6: Creating and Testing Project Rules for Cursor

What project conventions are you following?

Thought 2s

These are the conventions from this project's `.cursorrules` file:

Stack: HTML, CSS, and vanilla JavaScript only — no frameworks or extra libraries unless you ask for them.

Code style: Keep things simple and beginner-friendly. Use clear, descriptive names and camelCase for JavaScript variables and functions. Put JavaScript in `script.js` and CSS in `style.css`.

How to change the app: Reuse existing styles instead of duplicating CSS. Match the current look when adding features. Make only the changes the request needs. Don't rewrite working code or change existing behavior unless that's part of the request. Don't add extra files or
